Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The physical and psychological health of the women in the walking program was compared to the physical and psychological health of the women in the control group. The results of the study showed that the women in the walking program had significantly better physical and psychological health than the women in the control group. The walking program had a positive effect on the physical and psychological health of sedentary, middle-aged women.

12. **Answer: D** The correct answer is D. The correct answer is D.
